

# Atrium AI

The platform that gives the best AI models  
a **Digital Twin** of your company

## 01 In brief

---

Atrium AI connects the strongest AI models available (ChatGPT, Claude, DeepSeek and others) to a Digital Twin of your company: to its clients, prices, contracts, figures and established ways of working. What you get is an assistant that drafts documents, reports and presentations, carries out tasks and answers questions, working from the real information of your own business.

Once your data is connected, the AI knows the company the way an employee of several years knows it. Its work can therefore be used straight away: a quote takes the client's history into account, a report is built from your own real figures, and an answer comes with a link to the source it rests on.

## 02 The company's Digital Twin

---

At the heart of the product is the Digital Twin, a continuously updated digital model of the company. The system builds your data into a connected structure: databases, structured records, and a network of linked facts about products, clients, processes, figures, rules and people, where records refer to one another and back to their sources.

Facts are attached to particular people, clients and products, so the whole accumulated history of any one of them can be assembled at once. Every fact carries a source, a version and a date: where the information came from and how fresh it is are always visible. The twin lives alongside the company: new documents, answers and decisions add to it, while information that has gone stale is flagged and replaced.

**For every task, the AI receives a whole picture of the business from the Digital Twin, not a set of scattered documents.**

## 03 Examples of AI at work

An employee sets a task or asks a question in the chat they already use; Atrium AI gathers the context it needs from the Digital Twin and passes it to the model along with the task. A few examples:

### FOR A SALES MANAGER

**"Draft a quote for company X"**

The assistant will put the document together from that client's history and your current prices.

### FOR REPORTING

**"Pull together the quarterly report", "Make a presentation on the month's results"**

Produces a document or a presentation from your data.

### FOR A DIRECTOR

**"Why did sales fall in March compared with February?"**

Compares the figures across your tables and names the likely causes, with links to the sources.

### FOR ANY EMPLOYEE

**"What are the payment terms in the contract with supplier Y?"**

Finds the document and quotes the exact clause.

### FOR ROUTINE PROCESSES

**Filling in documents, tracking deadlines, creating tasks**

Actions are run with whatever level of confirmation you require.

### FOR A NEW JOINER

**Questions about internal rules and procedures**

They can ask the assistant directly, without taking up a colleague's time.

On the same foundation we can also set up specialised agents for sales, customer support, procurement, finance and document handling. All of them run on one Digital Twin, so new scenarios appear without gathering the knowledge a second time.

## 04 How the product works

The Digital Twin is formed in two stages:

### 1 Interview

The director and the employees responsible answer questions put to them by the AI. This is how the Digital Twin takes in what no document records and what usually lives only in people's heads.

### 2 Documents and data

You upload every file connected with the company: PDF, Word, Excel, CSV, along with scans and photographs of documents, which the system is able to read. A Google Drive folder can be connected, after which new and changed files are picked up automatically. We will also set up connections to your working systems: CRM, ERP, 1C, email and others.

**Important:** nothing enters the Digital Twin automatically. The system works through the uploaded files and shows an employee what it has understood and what it is unsure about: ambiguous passages, possible duplicates, contradictions. A person checks and approves, and only then does the information enter the Digital Twin. A separate checking module watches over the parsing so that no line of the source data is lost or distorted.

## 05 Security and data control

---

- **Everyone sees only what is theirs.** Employees have different access rights and the AI observes them: an ordinary manager will not receive data through the chat that only the director may see. Rights are checked before the information reaches the model.
- **The model never receives “the whole database”.** For each question the AI is handed only the permitted part of the Digital Twin that the answer requires, never a copy of all the company's data.
- **Documents cannot give the system orders.** An uploaded file counts as data, never as instructions: even where malicious text is hidden inside a document, it cannot change the rules of operation or of access.
- **Every move is on record.** A log is kept of who uploaded, changed and approved what; every fact has a source and a date.
- **Fitted to your requirements.** Production infrastructure, backups, single sign-on (SSO), antivirus scanning, retention periods and the rules for cross-border data transfer are agreed with each customer individually.

## 06 Independence from any single AI provider

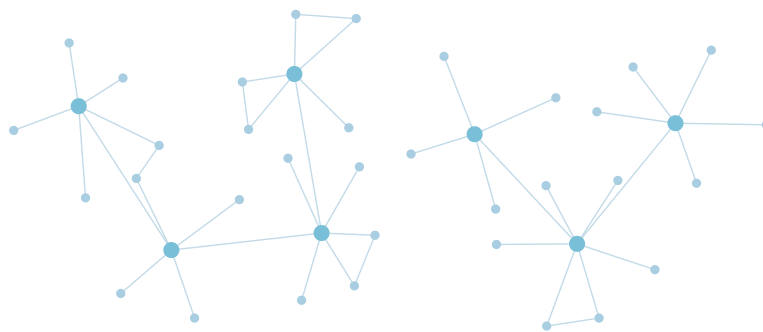

---

The Digital Twin is held on the platform's side, outside ChatGPT or any other external service. The AI model remains a replaceable part: you can use ChatGPT, Claude, DeepSeek and other models, switch between them, and connect stronger ones as they appear, all without losing the Digital Twin. The company never ends up locked in to one provider.

## 07 In closing

---

Atrium AI turns the best available AI models from clever outsiders into a corporate intelligence that understands one particular business: it drafts documents, reports and presentations, automates processes, answers questions and helps decisions get made, working from the Digital Twin and within each person's access rights.
